

Webtrees - Individual changes tab module

Created by Nigel Osborne, for the [Our Families](#) website

Introduction

This module adds a tab on the individual pages, titled “Changes. It displays the data from the “changes” log table in the database. Similar to the “Changes log” available in the Control panel, but in read-only format and only showing changes to the individual being viewed.

Installation

The download is in a zip folder. That contains a single folder with the name of the module. Extract that folder from the zip container and place it in webtrees’ “**modules_v4**” folder.

Visit the webtrees “Control panel”, and look at the list “All modules” Check that this custom module “Changes” is ticked as ‘enabled’. You should also disable the standard module of the same name.

Note: this version is distinguishable from the standard version in the control panel by the addition of “Custom module”, and the author ’s name etc. in the title area.

Use

In Control Panel > Modules > Individual page > Tabs you can adjust the visibility (visitors, members, managers, etc), and also it’s position among the other the tabs.

There are no other settings or other options available for this module.

Translations are all taken from the standard control panel version, so no customisation of these should be necessary.
